

RP-Monitoring in decommissioning

Joakim Gustavsson

Oskarshamn Nuclear Power Plant, OKG

Email: Joakim.Gustavsson@okg.uniper.energy

We have worked with nuclear power plants in operation for many years and we know how to act and what to do in many different RP-situations. When a nuclear power plant are in decommissioning we don't have the same experience. Right now we at OKG are in the middle of characterization and categorization of systems and objects. So how do we know what good looks like and what do we do to get there? One thing we can do is to monitor RP. At OKG we have a some KPI:s (key performance indicators). We follow trends in the CAP-system and we have started to categorize radiological events. We follow up all individual dose, collective dose and spread of contamination on our visual management boards.
